

MGU Weekly Progress Report

Reporting Period: August 17–24, 2026

Executive Summary

This week marked a transition for Malone Global University from broad technical remediation toward focused curriculum development and academic organization.

The first major workstream continued the recent effort to remove mojibake and related encoding problems from existing MGU web content. A large number of previously existing files across both the **Department** and **Library** structures were processed as part of this cleanup. The modification record shows large groups of files updated at identical timestamps across areas such as Art, Computer Science, Mathematics, Business, Defense, Engineering, Geography, and other encyclopedia collections, indicating systematic site-wide remediation rather than individual editorial revisions.

Following this maintenance phase, development shifted increasingly toward two substantive academic projects: continued production and review of the **French language textbook series** and a major reorganization and expansion of **Malone Math**.

1. Website Remediation and Mojibake Cleanup

A major operational objective during the period was continued normalization of existing MGU HTML files.

Previously created pages throughout the MGU Department and Library directories were processed to remove encoding artifacts and improve consistency. The modification history shows broad activity across existing departmental and encyclopedia structures, including Computer Science, Art, Mathematics, Business, Engineering, Defense, and other subject areas.

This work should be classified primarily as **infrastructure and content remediation**, rather than new page production. The large clusters of identical modification times are consistent with systematic migration or cleanup operations affecting many files in a single pass.

The remediation effort represents an important stabilization milestone for MGU because it improves the reliability of the existing content base before additional academic material is layered onto it.

2. French Textbook Development

After the bulk remediation work, attention shifted toward continued development of the MGU French curriculum.

Work concentrated on the upper-level French materials, particularly **French Speak and Write, Volume IV**, with chapters undergoing iterative review for:

- grammatical and linguistic accuracy;
- CEFR-appropriate scope;
- chapter sequencing;
- exercise quality;
- institutional and professional vocabulary;
- reading and listening integration;
- publication readiness.

The editorial process has increasingly moved from first-draft creation toward **quality assurance and publication review**, with chapters being revised repeatedly until major scope and accuracy issues are resolved.

This represents a maturation of the French program from content generation into formal textbook production.

3. Mathematics Explorations

A second major academic development stream involved the continued expansion of the modular **Mathematics Explorations** series.

Several concept-centered lesson sets were developed or expanded during the week, including:

- **Work, Rate, and Time**
- **Mixture Problems**
- **Proportion**

These lesson sets were structured around a central mathematical principle followed by conceptual lessons, problem classes, worked examples, and connections to related mathematical ideas.

This work further established the instructional model for Mathematics Explorations: rather than relying exclusively on rigid chapter progression, mathematical ideas are organized into modular clusters that can connect naturally to related concepts.

4. Mathematics Encyclopedia Expansion

The MGU Mathematics Encyclopedia also received substantial new terminology development.

Work continued across numerous mathematical domains, including:

- foundational mathematics and logic;
- algebraic structures;
- geometry and topology;
- calculus and analysis;
- probability and statistics.

Recent terminology development included foundational concepts, inverse trigonometric functions, altitude terminology, geometric area concepts, algebraic definitions, and related reference material.

Existing mathematics encyclopedia structures also appeared in the remediation record, including linear algebra, set theory, mathematical reasoning, statistics, geometry, discrete mathematics, and applied mathematics.

This work is steadily transforming the mathematics reference collection into a more systematic encyclopedia rather than a loose collection of definitions.

5. Malone Math Reorganization

The most strategically important development late in the week was the reorganization of **Malone Math**.

Older Malone Math material was reviewed alongside existing lesson files, including operations, the number line, polynomials, and related algebra material. The modification record confirms renewed work on these older instructional resources.

The project increasingly moved away from the older linear textbook structure toward a broader conceptual architecture.

Major divisions under development now include:

Foundational Structures

Algebraic Relationships

Spatial Relationships

Discrete and Stochastic Relationships

Modeling and Analysis

Reference

The most developed area is currently **Foundational Structures**, particularly the **Mathematical Language and Objects** sequence. This work addresses subjects such as mathematical objects, abstraction, notation, variables and constants, definitions, statements, equality and equivalence, classification, and the distinction among terms, expressions, equations, formulas, and identities.

This restructuring represents more than a table-of-contents revision. It establishes a conceptual framework for how Malone Math will explain the organization and relationships of mathematics itself.

6. Mathematical Instruction and Legacy Material

Older Malone Math instructional material also continued to receive focused attention.

Work included review and redevelopment of material involving:

- the six basic operations;
- number-line interpretation;

- algebraic notation;
- functions;
- matrices and elimination;
- graphing;
- mathematical terminology and conventions.

Particular effort was directed toward refining how mathematical ideas are taught, including clearer sequencing, conceptual explanations, practical procedures, checking strategies, and explicit connections among related concepts.

The objective remains to preserve the conversational, tutor-led character of Malone Math while improving mathematical precision and structural coherence.

7. Engineering and Publishing Infrastructure

Supporting technical work continued alongside content development.

Activities included:

- HTML cleanup and standardization;
- maintenance of page templates;
- MathJax implementation and troubleshooting;
- PowerShell-based file auditing;
- creation of development activity records;
- continued use of shared Department and Library components.

The modification log itself now provides a useful distinction between newly created material and older files revisited during maintenance or editorial work. The current scan was specifically configured to identify existing files whose modification time fell within the previous seven days while excluding newly created files and Git internals.

A continuously accumulating MGU development ledger is also being established to provide better long-term visibility into project activity.

Overall Assessment

The week's activity can be understood as a progression through three operational stages:

1. Remediation: large-scale cleanup of encoding and HTML problems across existing Department and Library content.

2. Content Development: continued production and refinement of French textbooks, Mathematics Explorations, and mathematics reference material.

3. Consolidation: movement toward a more coherent, long-term architecture for Malone Math.

The most significant development is the third stage. MGU mathematics work is increasingly shifting from producing individual pages toward defining an integrated instructional and reference system.

The immediate result is a cleaner underlying website, a more mature French curriculum, continued growth of the mathematics reference library, and a substantially clearer organizational direction for Malone Math.
